This data is accurate as of April 26, 2021. Due to ongoing product changes, updated test results or new industry standards or requirements, this data may change over time. Check the product labels to confirm NFRC values. Ratings are for sizes specified by NFRC for testing/certification. Ratings may vary depending on use of tempered glass, different grille options, glass for high altitude areas, etc.

1) U-Factor defines the amount of heat loss through the total unit in BTU/hr/ft².°F. The lower the value, the less heat is lost through the entire product. Window values represent non-tempered glass unless otherwise noted. Use of tempered glass can increase U-Factor ratings. Door values represent tempered glass.

2) Solar Heat Gain Coefficient (SHGC) defines the fraction of solar radiation admitted through the glass both directly transmitted and absorbed and subsequently released inward. The lower the value, the less heat is transmitted through the product.

3) Visible Light Transmittance (VLT) measures how much light comes through a product (glass and frame). The higher the value, from 0 to 1, the more daylight the product lets in over the product's total unit area. Visible Light Transmittance is measured over the 380 to 760 nanometer portion of the solar spectrum.

NFRC ratings are based on modeling by a third party agency as validated by an independent test lab in compliance with NFRC program and procedural requirements.

* Optional foam in frame included.

** Available for select patio door sizes. Data based on blinds in full open position.
